

Budget 2026 Walkthrough

1. Executive Summary

Objective of the Budget

- The primary objective for Ualá in 2026 is to prove sustainable profitability in AR following a difficult 2025 in which our credit growth initiatives largely backfired amid a harsh lending environment. Our budget projects this will take place in December 2026.
- We will continue to invest in scale; however, this budget reflects a decisive **flight to quality**, prioritizing performance-driving metrics over headline growth, with a focus on:
 - **Gross Profit, not revenue alone** — top-line growth that doesn't convert to gross profit consumes capital without building a sustainable business.
 - **Quality, engaged users, not total TAUs** — acquisition-driven user counts that don't monetize inflate metrics without creating value; the focus shifts to users who actively transact, save, and borrow.
 - **Performing credit portfolio and cost of risk, not gross book size** — portfolio volume without quality control was a key driver of 2025 provisions; disciplined origination and cohort performance matter more than book size.
 - **Risk-adjusted returns and capital efficiency** — capital is finite; every deployment is evaluated against its expected return, prioritizing quality of growth over quantity.
- Only initiatives with a defined launch date and a quantifiable estimated impact are included in these projections. Other initiatives (e.g., enhancements to the Home) that could materially improve user engagement and other key metrics are not incorporated, as their impact cannot yet be reliably quantified.
- We expect to invest approximately USD 86.7 M in 2026, with USD 65.4M representing the real BTL liquidity needed after unlocking restricted cash (via Ceibo integration) from HoldCo-level entities (see Capitalization section). Stripping out the 2025 provisions overhang and other one-off items — performance bonus and restructuring severance — **the normalized capital requirement is USD 65.5M** with 2027 annualized capitalizations at USD 8.4 M (see Capitalization section for further details)

OKRs in the Numbers

The 2026 budget operationalizes Argentina's north star — to become the largest bank in the country serving users across segments — by translating the OKR objectives into five concrete impact levers.

1. **Revenue diversification:** Expanding capital-light revenues and strengthening engagement to diversify the revenue base.
 - a. **Users & engagement:** Building a monetizable active user base through higher-quality acquisition and deeper engagement to sustain growth in transactional active users.
 - b. **Net fee income expansion:** Strengthening Net Fee Margin and diversifying the revenue mix through structural improvements in the payments P&L (including Prisma migration), new SmartPOS acquisitions in Bis, and product enhancements in Wealth.
2. **Profitable & sustainable balance growth:** Scaling credit while maintaining disciplined risk and improving balance sheet quality.
 - a. **Quality credit growth:** Tight control of new-cohort delinquencies and cohort ROEs through upgrades to UaláScore and BehaviorScore, deeper micro-segmentation, active portfolio management, payroll-deducted lending, and deeper Ceibo integration.
 - b. **Balance sheet optimization:** Reducing cost of funds through product improvements and a more efficient funding mix to strengthen margin stability and capital efficiency.
3. **Cost efficiency:** Simplifying the cost structure to improve operating leverage.
 - a. **Operating efficiency:** Organizational simplification, targeted headcount reductions, and automation (e.g., Collections, CX) to improve efficiency while preserving core capabilities.

Each P&L dimension in the budget is directly linked to the company's OKRs. The financial levers driving revenue, costs, and profitability correspond to specific objectives, key results, and measurable components, ensuring that operational performance and financial outcomes are aligned with the strategic priorities for 2026, as detailed in the sections across the document.

Where Execution Risk Lies

- Argentina remains a credit-heavy business operating in a country with a long history of macro volatility. Structural mismatches between asset duration and liability structure continue to require active risk management.
- Credit performance remains the core value driver — and the primary risk. Regulatory uncertainty (including IFRS 9 capital treatment and interchange evolution) and potential macro disruptions could materially affect outcomes.
- Net fee income income improvements assume
 - Continued growth in our wealth business, which has in the past thrived in more volatile macroeconomic conditions.
 - Processing migration is delivered on time (June)
- Ceibo integration plan is a critical step to unlocking BTL HoldCo restricted cash - delays to this project represent a material deviation in total HoldCo capital requirements.
- The personnel restructuring and AI-driven automation initiatives carry meaningful execution risk. A 20% workforce reduction alongside concurrent process automation requires rigorous sequencing to avoid disruption to core business functions

The following sections walk through the 2026 Argentina budget across each major P&L line, linking financial performance to the strategic priorities derived from our OKRs.

- **Marketing, user acquisition and engagement:** Users & Engagement (Revenue diversification OKR): Shows how the acquisition engine and engagement strategy expand the active user base and strengthen primary banking relationships.
- **Net fee income:** Net fee income expansion (Revenue diversification OKR): Details the structural and volume drivers that diversify revenue through capital-light products across Payments, Bis, Wealth, Insurance and credit-linked fees.
- **Net interest income:** Quality credit growth & balance sheet optimization (Profitable and sustainable balance growth OKR): Explains how disciplined credit origination, improved risk models, funding optimization and treasury performance drive sustainable NIMAL expansion.
- **Gross profit:** Combined impact of revenue diversification and credit normalization: Illustrates how improvements in fee economics and normalization of cost of risk translate into a step-change in gross margin.
- **OPEX:** Operating efficiency (Cost efficiency OKR): Outlines the structural cost reset through marketing discipline, supplier optimization, automation and personnel restructuring to improve operating leverage.
- **Operating income:** Financial outcome of the strategy: Demonstrates how gross profit expansion and disciplined cost management drive the path toward operating breakeven.
- **Capitalization:** Balance sheet support for growth: Explains the capital requirements needed to sustain credit expansion while maintaining a stronger solvency position.

2. Marketing, User Acquisition and Engagement

User Growth Targets

- Total users
 - New account growth is supported by a consistent acquisition engine that projects ~246k monthly installs, which then flow through the funnel to deliver ~68k new accounts per month, split between:
 - ~48k organic additions
 - ~20k accounts generated through ~USD 50k/month of paid acquisition spend
 - Strategically, acquisition is shifting toward higher-quality profiles with stronger propensity to adopt Wealth and Credit products, improving engagement and the monetization mix.
- Active users
 - Total active users (RAUs) are expected to reach 3.2 M while Transactional Active Users (TAUs) are projected to reach ~1.75m (EoP 2026), representing ~4% YoY growth

Major drivers

- **Deeper understanding of target segments is now shaping product priorities:** through dedicated research conducted during Q1, we identified the main needs and

frictions of our priority segments, giving us a much detailed view of what drives engagement, retention and monetization

- **Roadmap prioritization will increasingly follow segment lens:** rather than continuing with a broad, one-size-fits-all model, 2026 developments will be selected based on their ability to solve the most relevant pain points of target users and strengthen product-market fit where we see the highest strategic value.
- **The goal is to build a more coherent and differentiated ecosystem for high-potential users:** a more tailored offer by segment should help us move toward stronger user relationships, with higher retention and sustainable long-term growth.
- **Early-retention-driven acquisition strategy:** acquisition efforts will increasingly focus on activation journeys that drive engagement in the first 0–90 days toward high-stickiness products, particularly Wealth. Users who activate through Wealth show materially stronger unit economics (GPAC at M6 ~USD 5.7 vs ~USD 0.3 for cash-in users), contribute positively to credit scoring and are overrepresented in our priority segments, making them a more attractive cohort for sustainable growth.

OKRs to P&L Linkage

Improve efficiency while preserving user satisfaction		
		Efficiency ratio below 62.1%
		Acquisition cost per TAU below USD 1.2
		Payback period per TAU
		GPAC per TAU above USD 22.6
		User Quality acquisition above 50% by end of 2026
		Growth of products per user of 10%
Diversify revenue streams to strengthen resilience		
		Average Revenue per Active Customer above USD 141.8
		Active retail user base penetration by business
		Credit active user base penetration (TAUs) of 37% by end of 2026
		Payments active user base penetration (TAUs) of 28% by end of 2026
		Wealth active user base penetration (TAUs) of 3.7% by end of 2026

Channel Strategy

Engagement Metrics

3. Net Fee Income

Net Fee Income becomes a stronger and more diversified contributor in 2026, supported by healthier unit economics from strategic changes and higher volumes, reducing reliance on credit-driven profitability and improving capital-light margin generation.

Net fee income increased from USD 0.6M in Jan-26E to USD 1.9M in Dec-26E (+USD 1.3M), driven primarily by Wealth and Payments improvements, with additional contribution from Bis scaling.

Major Drivers

1. Wealth: **Dec-26 Net Fee Income ~ flat vs Dec-25 (against a high base from extraordinary volumes linked to the FX spread macro context)**
 - a. FX trading followed a similar pattern: strong traction around the October 2025 launch/election period, followed by normalization as the FX gap narrowed—reducing the ‘rulo’ incentive—together with BCRA restrictions and partial cannibalization between Official and MEP. For 2026, we assume a stable run-rate with seasonal peaks in July and December driven by Aguinaldo.
 - b. Targeted acquisition reinforces Wealth growth: As described in the previous section, user acquisition increasingly prioritizes profiles with higher propensity to adopt Wealth products, strengthening engagement and supporting AUM growth as a larger share of new users enters the platform with trading potential.
 - c. In parallel, trading-platform upgrades (interactive charts and broader UX improvements) are expected to increase engagement, lifting AUM and overall trading activity as the base of active users expands.
2. Payments: **Dec-26 Net Fee Income +USD 0.6M vs Dec-25 (exc. Mastercard rebate)**
 - a. In 2H26, two key milestones structurally improve unit economics. First, the processing migration is completed in July—driven by Alau’s migration to Uilo—eliminating GP costs from that month onward. Second, starting in 2H, a significant share of QR volumes is expected to migrate to Mastercard rails, improving margins on existing TPV.
3. Bis: **Dec-26 Gross Profit +USD 0.3M vs Dec-25 (~116% increase)**
 - a. Deployment of existing and newly 5k upgraded POS Pro devices supports on-site volume growth, with a focus on higher-ticket merchants and improved mix quality throughout the year.
 - b. Ramp up online volume after investing in both (i) fraud reduction measures and (ii) very small pilot with a commercial team
4. Insurance: **+USD 0.2 of Net Fee Income contribution in 2026**
 - a. A new vertical is launched, with Life Insurance introduced in January and Personal Accident Insurance planned for March.
5. Credit Linked Fees: **Dec-26 Net Fee Income -USD 0.1M vs Dec-25 (mainly explained by lower credit card issuance)**
 - a. The implementation of pre-cancellation fees drives incremental fee income while mitigating prepayment risk and protecting realized portfolio yield.

Key Outcomes

- Net Fee Income delivers strong gross margins throughout 2026, supported by higher volumes and healthier unit economics, in particular by the step-change in Payments unit economics following the processing migration.

- By year-end, Net Fee Income approaches ~USD 2M in monthly gross profit—around 25% of total gross profit—with additional upside in 2027 from subscriptions, institutional sales, SME monetization, crypto revenues, and continued wealth product expansion (See Detail in Appendix).

This delivers meaningfully on the diversification commitment embedded in the 2026 strategy.

OKRs to P&L Linkage

Diversify revenue streams to strengthen resilience		
	Average Revenue per Active Customer above USD 141.8 by end 2026	
		Payments ARPAC of USD 9.5 by end 2026
		Wealth ARPAC of USD 7.2 by end 2026
		Bis ARPAC of USD 5 by end 2026
		Risk-Adjusted Net Revenue per Active User (TAU) of USD 85.7 by end 2026
	Active retail user base penetration by business	
		Insurance active user base penetration (TAUs) of 1% by end 2026
Improve efficiency while preserving user satisfaction		
	Efficiency ratio below 62.1% by end 2026	
		Direct fee costs per TAU of USD 13

4. Net Interest Income and Provision expense

Argentina's performance remains closely tied to disciplined execution in credit. In 2026, our focus is twofold: delivering quality growth while completing the clean-up following 2025 headwinds.

Net Interest Income After Losses (NIMAL — defined as Net Financial Income minus Provision Expense) is the primary profitability driver for the Argentina business and the metric that best captures the combined effect of credit quality, funding costs and treasury performance. NIMAL is budgeted to improve from USD (8.6M) in 2025A to USD 24.5M in 2026E — a USD 33.1M swing — reflecting three concurrent drivers:

- **Quality-led credit growth:** Disciplined origination with tighter underwriting standards, upgraded Ualá Score model and Behaviour Score and diversified credit portfolio mix are expected to drive a structural reduction in cost of risk while allowing to keep growing Credit book — at a lower pace than 2025
- **Funding optimization:** Cost of funds is kept below reference rate through three levers:
 - a disciplined rate strategy via HYSA tiering, where higher rates are unlocked only upon reaching balance thresholds;
 - new product features, such as new "Live" HYSA feature, where user unlocks higher rates after reaching targets mid-month rather than starting each month where they left off in prior month; and
 - active management of funding mix toward lower-cost deposit categories as the liability base scales
 - elimination of more expensive (approx 5-10 p.p) third party debt instruments through the integration of Ceibo and merger of Alau with UaláBank
- **Treasury investment margin improvement:** Treasury NIM benefits from two concurrent effects: (i) higher yields on the existing investment portfolio, reflecting securities purchased at elevated rates during 2025 and carried at amortized cost — locking in above-market returns as rates decline; and (ii) lower funding costs, which directly widen the spread between portfolio yield and cost of funds

Quality-Led Growth

Origination Strategy & Portfolio Mix

Origination strategy is centered on deepening monetization of our existing user base while targeting new user acquisition toward the same highest-quality segments, optimizing risk-adjusted returns.

- Core growth remains in Personal Loans, supported by further upgrades to UaláScore and Behavior Score.
- Increased micro-segmentation and active portfolio management.
- Targeted growth in performing loans, prioritizing credit quality rather than volume acceleration

To diversify risk, payroll-deducted lending will be onboarded through a third-party agreement from April onwards. While lower margin than unsecured personal loans, this product strengthens portfolio resilience and reduces concentration risk by introducing a structurally lower-default segment into the book.

Structural Shift: Origination into the Bank

During 2026, all new credit origination will migrate into the bank:

- Personal Loans: January (already completed)
- Installments: April
- POS Loans (Ceibo): July

This eliminates costly and operationally complex portfolio purchases (we spend USD 1.6 M in incremental taxes in 2025 for portfolio sales operations) while fully leverages the bank's structural cost-of-funds advantage and simplifies capital and operational management across the group

Stricter Provision Policies

Argentina's provision strategy shifts to a more conservative, clean-up driven approach that accelerates loss recognition and supports faster portfolio normalization.

- Historically, loans past due beyond 90 days were provisioned at 75% in line with IFRS guidelines. In December 2025, this policy was updated to apply 100% provisioning coverage to all exposures in the +360 DPD bucket, better reflecting the low recovery expectations on deeply delinquent balances.
- From April 2026, the budget assumes a further tightening: 100% provisioning coverage will be applied from the +180 DPD threshold, with the residual portfolio sold at approximately 8% of accounting balance. This policy shift implies an estimated USD 10M one-off charge absorbed in April 2026.
- In parallel, IFRS 9 model parameters are recalibrated on a quarterly basis — in April, July and October. Each recalibration updates the Expected Credit Loss (ECL) assumptions applied at origination, incorporating the latest portfolio performance data and macroeconomic projections

Funding Optimization

Cost of funds is projected to continue below reference rate through three levers

- Continue a disciplined rate strategy mainly via HYSA tiering, where higher rates are unlocked only upon reaching balance thresholds
- Product improvements such as the “Live” HYSA, where rate upgrades are triggered only upon achieving monthly targets, allow us to lower the cost of funds as users are remunerated at the base rate until they reach targets .
- Active management of funding mix toward lower-cost deposit categories as the liability base scales.

Treasury Investment Margin Improvement:

Treasury NIM is expected to benefit from two concurrent effects:

- Higher investment yields (compared to reference rate), reflecting securities purchased at elevated rates during 2025 and carried at amortized cost — locking in above-market returns as rates decline
- Lower funding costs, which directly widen the spread between portfolio yield and cost of funds

OKRs to P&L Linkage

Drive profitable and sustainable balance growth		
	Stabilize and restore credit portfolio quality while rebuilding sustainable, risk-adjusted profitability	
		Credit portfolio size of USD 226.3M by end 2026 with a blended NPL +90 < 7.9% by end 2026
		Personal Loans portfolio of USD 130.1M by end 2026 with NPL+90 < 8.7% by end 2026
		Consolidated portfolio Roll Rates (1-30) below 5.3% by end 2026
		Collection Efficiency 1-30 above 34.9% & 30-60 above 8.7% by end 2026
		Credit IMAL Over Gross Portfolio (excluding +180) of 20.3%
		Cost of risk (provisions / average loan book) < 47.2% on a rolling 12 month basis
	Maintain a stable, diversified and cost efficient funding base that supports sustainable growth	
		Loans to Deposits ratio of 0.4x
		Average NIM of 5%
		Cost of funds at 0.8x TAMAR/Cauciones
Diversify revenue streams to strengthen resilience		
	Average Revenue per Active Customer above USD 141.8	
		Risk-Adjusted Net Revenue per Active User of USD 85.7 by end 2026

5. Gross Profit and Gross Margin

Gross profit improves from USD (2.8M) in 2025A to USD 47.7M in 2026E — a USD 50.5M improvement — driven by two structural changes.

- Net fee margin expands from 21.4% to 39.7%, reflecting the elimination of processing costs following the Prisma migration in July, complemented by fee revenue growth across Bis, Payments, Wealth and Insurance
- Net Interest Margin recovers materially as cost of risk normalizes from 52.4% in December 2025 toward 32.3% by December 2026 (~20pp improvement) and treasury margin widens — with the investment portfolio yielding above TAMAR while funding costs remain at ~0.8x TAMAR. By December 2026, monthly gross profit reaches USD 7.8M at a 32.0% margin, establishing the run-rate foundation for sustained profitability into 2027.

6. OPEX

In 2026, Ualá will continue to prioritize operational leverage and structural efficiency, ensuring that cost growth remains below gross profit growth.

Marketing Discipline

Marketing is budgeted at USD 6.0M in 2026, down from USD 7.4M in 2025A — a 19% YoY reduction- The decline in total spend is accompanied by a meaningful improvement in capital efficiency; with yearly marketing spend per Transactional Active User (TAU) projected to decrease from USD 4.3 in 2025 to USD 3.5 in 2026, reflecting a deliberate shift toward higher-quality users and a targeted acquisition strategy.

Supplier & Structural Cost Optimization

Overhead & IT is budgeted at USD 30.0M for 2026 (vs. USD 28.6M in 2025A, +4.8% YoY). The total increase is driven entirely by Technology & Security spend, which increases

approximately 21% in line with Ualá's expanding ecosystem; non-technology overhead declines ~18% as a result of a company-wide cost discipline exercise.

Non-technology overhead is budgeted to decline approximately 18% year-over-year, with each area committing to a reduction in non-essential expenditure relative to 2025 actuals. Savings levers include: (i) Elimination of non-critical third-party services; (ii) Renegotiation of existing vendor contracts; (iii) **Consolidation** of supplier relationships; (iv) Internalization of select previously outsourced capabilities.

Tech & Security spend grows ~23% YoY, consistent with the continued buildout of Ualá's product and ecosystem offering. This category is explicitly excluded from the non-tech reduction target given its role as a direct enabler of revenue growth and operational resilience.

Gross tech cost growth is partially offset by a structured savings plan developed by the Tech team:

- **Total annualized savings opportunity:** USD 5M
- **Key initiatives:** AWS infrastructure tuning to eliminate utilization inefficiencies; in-housing / migration of select providers (Null Platform, Verisec, PTS)
- **2026 budgeted savings:** ~USD 1M (~20% of annual target), reflecting a ramp to 50% of monthly run-rate by December 2026, weighted to 2H
- **Full run-rate benefit** (~USD 5M annually) expected from 2027 onwards as migrations reach steady state

Personnel Efficiency

Building on efficiencies achieved during 2025, the 2026 plan is designed to continue delivering personnel cost savings through structural simplification and automation-led productivity gains. Total personnel expenses are budgeted at USD 48.7M in 2026, down from USD 62.2M in 2025A — a reduction of USD 13.5M, or approximately 22% YoY. Excluding Severance costs for 2025 and 2026, personnel spend also went down 22% (from 57.5 M to 44.9 M)

The objective is a one-time headcount reduction of approximately 20% by May, complemented by ongoing efficiency measures across the remainder of the year.

- **Automation:** AI-enabled workflow redesign in transactional areas — particularly CX and collections — to reduce manual effort and improve throughput per FTE
- **Reorganization:** Elimination of functional duplication, following a comprehensive review to define a more efficient operating structure designed to:
 - Create a more horizontal organizational structure
 - Ensure decision making agility and accountability
 - Reduce costs
- **Roadmap streamlining:** Focus resources on a smaller set of high-priority OKRs, improving productivity per FTE by reducing context-switching and initiative sprawl

In addition to the above, the plan assumes incremental savings from non-replaced attrition throughout the year, providing a natural and ongoing reduction in headcount cost beyond the one-time restructuring.

As automation scales, key performance indicators — including NPS and collections efficiency — will be monitored closely to ensure cost reductions do not compromise customer experience or credit performance.

The 2026 overhead plan is therefore built around disciplined spend control, structural simplification and automation-led productivity gains, reinforcing the broader “flight to quality” strategy.

Other Operating Expenses:

Other operating expenses are budgeted at USD 25.2M for 2026 (vs. USD 31.8M in 2025A, -20.7% YoY). The largest component is Ingresos Brutos (IIBB), Argentina's gross receipts tax, budgeted at USD 15M in 2026 vs. USD 20M in 2025A — a USD 5M reduction representing the most significant driver of the YoY improvement.

IIBB is a gross receipts tax applied to revenues, with a particularly significant impact on the credit portfolio given that loan interest income is taxed at an 8% rate. The USD 5M YoY reduction reflects a structural improvement in tax efficiency: as credit is originated directly through Ualá Bank in 2026, the business eliminates the need for portfolio sales, which historically triggered additional IIBB and other tax burdens at the point of transfer.

The 2026 budget does not assume any tax reform or reduction in the applicable IIBB rate. This is a conservative assumption; for reference, each 1 percentage point reduction in the gross receipts tax rate applied to credit revenues would imply approximately USD 1.3M in lower charges, based on the 2026 budget credit projections.

OKRs to P&L Linkage

Improve efficiency while preserving user satisfaction		
	Efficiency ratio below 62.1% by end 2026	
		Non acquisition cost per TAU of USD 2.3
		Overhead & Personnel costs per TAU of USD 46.1
	User contact rate below 6%	
		App Uptime at 99,9%
		NPS above 65

Note: Efficiency Ratio is defined as Total Operating Expenses divided by NII and Fee Income net of Transactional Cost and Revenue-Based Taxes

7. Operating Income

The 2026 budget targets a decisive improvement in monthly operating performance, with December 2026 operating loss of USD (0.7M) representing a USD 7.6M improvement vs. the USD (8.3M) loss recorded in December 2025.

On an adjusted basis — excluding 40% of Argentina personnel expenses attributed to Mexico and Colombia operations — **December 2026 reaches operating breakeven, delivering USD +0.7M in monthly profit.**

The USD 7.6M improvement is driven by two concurrent levers:

- **Gross profit expansion (+USD 6.1M):**
 - Net Fee Income improves by Prisma processing migration in July (consolidating a USD 1.5M monthly run-rate) and complemented by transactional growth across all verticals
 - Net Interest Income After Losses (**NIMAL**): Improvement as quality-led credit growth scales through the bank and provision expense normalizes in 2H26 as legacy vintages run off

- **OPEX reduction (+USD 1.3M):** Driven by the April headcount restructuring (20% reduction, monthly personnel run-rate from ~USD 4.5M to ~USD 3.5M), lower operating taxes charges (bank origination structure) and overhead savings.

Summary Bridge — December 2025 vs. December 2026			
USD M	Dec-25A	Dec-26E	Δ
Gross Profit	1.7	7.8	6.1
Operating Expenses	(9.8)	(8.5)	1.3
— of which: Personnel	(4.5)	(3.5)	1.0
— of which: Overhead & IT	(2.7)	(2.2)	0.5
— of which: Other OpEx	(2.0)	(2.3)	(0.3)
— of which: Marketing	(0.1)	(0.5)	(0.4)
Operating Income (Reported)	(8.3)	(0.7)	7.6
40% Personnel adjustment	1.8	1.4	(0.4)
Operating Income (@40% Personnel)	(6.5)	0.7	7.2

8. Capitalizations

Regulatory Capital Requirements

Total capital injections into Argentina are budgeted at USD 86.7M in 2026, a 32.1% reduction vs. USD 127.7M deployed in 2025.

While the gross capital requirement stands at USD 86.7M, the plan unlocks USD 21.3M of previously restricted cash at the HoldCo level — primarily through the origination of Ceibo loans directly at the bank and Raíz project (partial spin off of Alau & subsequent merger with UalaBank). On a net basis, liquidity required from BTL to fund the Argentina plan amounts to **USD 65.4M**.

Capital Consumption Drivers

The 2026 consolidated operating loss is budgeted at USD 70.8M, while total capitalization reaches USD 86.7M — an excess of approximately USD 15.9M. This gap is mainly driven by two items:

Capital consumption dynamics at Ualá Bank (operate independently of the P&L)

- Stronger solvency target: The budget targets a 12% CET1 ratio (Regulatory Capital as a percentage of Risk-Weighted Assets), up from 10.3% in December 2025. This is achieved without relying on the existing IFRS 9 capital allowance — a regulatory mechanism that permits banks to add back the difference between IFRS provisions and regulatory provisions as capital. Excluding this allowance from the CET1 base

results in a more conservative and robust solvency position, but requires additional equity injection to restore the ratio to the 12% target.

- Loan book growth consumes capital: As Ualá Bank expands its credit portfolio, regulatory capital requirements grow proportionally with Risk-Weighted Assets. RWAs are projected to increase from ~USD 210M in January to ~USD 261M by December 2026, consuming approximately USD 13M in incremental capital from May onwards to maintain the 12% CET1 target.

Portfolio Sale Premium Treatment

Intercompany portfolio sales between Alau, Ceibo, and Uilo in 2025 created a timing difference between managerial P&L and capital requirements. Uilo acquired portfolios at below-origination yields, paying a premium that was recognized as a gain at Alau/Ceibo and activated as an asset at Uilo to be amortized over loan life. Managerial accounts exclude these premiums and their amortization, reflecting true economic accruals instead.

This generates a meaningful reconciling item in both years. In 2025, net premiums received exceeded Uilo's amortization by USD 12.6M, reducing capital requirements accordingly. In 2026, no new intercompany sales are planned — except the ~USD 13M Ceibo performing book transfer — while Uilo continues amortizing prior-year premiums, creating ~USD 9M of managerial revenue with no corresponding capital benefit.

This, combined with RWA growth and the stronger CET1 target, explains why capitalization requirements exceed the operating loss.

Capitalization Bridge — From Base Case to Normalized

The USD 86.7M total capitalization can be decomposed into six drivers, moving from the prior base case to the current scenario:

Stripping out items that are non-recurring or directly attributable to 2025 legacy effects — specifically: (i) provisions overhang; (ii) severance costs and; (iii) performance bonus — as well as increasing bank's solvency and restricted cash release, normalized capital requirements will sit in USD 65.5 M

#	Driver	USD M	Context
—	HoldCo capital requirement	65.4	
1	Restricted Cash Release	21.3	Ceibo integration & Bank/Alau merger eliminate external funding need and releases collateral cash previously locked at HoldCo (see appendix)
—	Required capital	86.7	
2	2025 performance bonus (paid in 2026)	(2.4)	Cash payment of the 2025 bonus falls in 2026; excluded from normalized view as it relates to prior-year performance
3	2025 provisions overhang (legacy Dec-25 portfolio)	(11.6)	Capital required to fully provision residual bad debt from 2025 vintages that was not absorbed last year — a one-time legacy clean-up
4	May 2026 restructuring severance (one-off)	(3.5)	One-off severance costs from the 20% workforce reduction; non-recurring and not part of the ongoing capital run-rate
5	Bank' solvency increase	(3.7)	Increase bank solvency restoring a 12% CET1 capital ratio
—	Normalized capitalization (ex. one-offs & 2025 carry)	65.5	

Capitalizations Waterfall:

2026 Consolidated Capitalizations Bridge (USD M)

2027 Annualized Capitalization Run-Rate

Based on current projections, **the 2027 capitalization run-rate is estimated at approximately USD 8.4M, derived as the December 2026 reported operating loss of USD 0.7M annualized.** This estimate rests on three assumptions:

- **No incremental growth:** Assumes no further expansion of the credit book that would require additional equity injection to maintain the 12% CET1 target
- **No further legacy credit charges:** All 2025 provisions overhang and +180 DPD one-off write-off impacts are fully absorbed by December 2026
- **Efficient cost structure across entities:** Assumes costs are properly allocated across legal entities, eliminating structural P&L imbalances that currently inflate capital needs at the consolidated level

8.1. Appendix: Ceibo Créditos Integration Plan

Ceibo's integration into Ualá Bank is a key capital efficiency initiative in 2026, primarily driven by the opportunity to release approximately USD 21.3M of restricted cash currently held at HoldCo as collateral against Ceibo's external credit facilities. The release of this cash materially reduces the effective liquidity need from BTL, as reflected in the capitalization bridge.

Integration Plan:

From July 2026, the integration is executed in two concurrent steps:

- **Platform integration:** Ceibo's POS scoring and origination platforms are integrated into Ualá Bank, with all new POS loan origination migrating into the bank from that month onwards
- **Portfolio purchase:** The majority of Ceibo's performing book (~USD 13M) is sold to Ualá Bank, consolidating the credit portfolio under the bank's balance sheet and triggering the release of previously restricted collateral cash at HoldCo

Following the portfolio transfer, Ceibo ceases new originations and begins running down its remaining book, repaying outstanding financial debt and consolidating operations into the banking entity.

Economic Impact:

The integration triggers additional IFRS 9 provisions as the acquired portfolio is brought onto the bank's balance sheet under its ECL framework — which applies more conservative coverage than Ceibo's existing provisioning methodology. However, this one-off provision impact is more than offset by four structural benefits:

- **Lower funding cost:** Ceibo currently funds origination through financial debt at market rates; the bank funds at deposit cost — a structurally cheaper and more stable liability

- **Lower underwriting costs:** Elimination of third-party origination costs and operational complexity associated with running a separate credit vehicle
- **Elimination of duplicities:** Consolidation backend functions reduces overhead across the group
- **Restricted cash release:** Redeployment of ~USD 16M of previously locked HoldCo collateral, directly reducing the net BTL liquidity requirement for the Argentina plan

9. Investments Projects

The 2026 Budget includes a set of investment initiatives that require upfront build and execution during 2026, with the majority of the revenue and growth impact expected to materialize in 2027 and beyond. These projects are designed to expand monetization and deepen ecosystem engagement.

OKRs to P&L Linkage

Develop new businesses	
	Launch SME bank accounts by mid-2026 and reach +300 open accounts by end 2026
	New banking business lines generating USD 5M by Dec 26 (pagarés bursátiles, compras de cartera, compra de cheques de pago diferido)
	Launch crypto by mid 2027

Premium Subscription Fees

- A premium subscription tier is being developed to monetize high-value users—consistent with peers that charge a monthly fee in exchange for enhanced benefits such as better interest on balances/savings and more favorable pricing on financial services (including trading fees). This initiative is included in 2026 as build cost only (no commercial launch assumed), with the primary revenue and growth impact expected to ramp in 2027

SMEs

- This plan contemplates investment to develop an end-to-end SMEs proposition, with most commercial impact expected in 2027. The initiative aims to offer small and medium-sized businesses a comprehensive account-based offering—enabling them to collect and make payments, manage liquidity, and access value-added services (e.g., remunerated balances), and lending products—leveraging the existing platform to expand into a new client segment and diversify revenue streams. Strategically, it also helps build a more scalable base of low-cost funding through operating balances, which can be deployed into lending and/or treasury investments.

Institutional Trading Desk

- The budget allocates investment to build out an institutional trading desk — the Mesa de Dinero — integrated across our broker-dealer (ALyC) and bank, operating across three business lines: Sales & Trading (focused on fixed income and other instruments for institutional counterparties), Institutional Mutual Fund Distribution (FCI cash-management products), and Professional Brokerage services for specialized traders and promoters.
- The model is capital-light by design: net investment requirement for 2026 is USD 915K, with no capital injection required — growth is funded by the business's own

profitability. Compensation is heavily variable, tied to quarterly net P&L, which aligns incentives and limits fixed cost exposure.

- The implementation roadmap targets revenue generation from Sales & Trading and Mutual Funds beginning June 2026, with the Brokerage line activating in January 2027. Business breakeven is projected for October 2027. Accordingly, the primary revenue contribution to the consolidated P&L is a 2027 story, with 2026 reflecting the investment and ramp-up phase.

Crypto

- The plan also includes foundational work to enable crypto and stablecoin capabilities within the Ualá ecosystem, leveraging the recently announced strategic partnership with Tether. During 2026, investment will focus on infrastructure, compliance, and product integration—allowing users to access stablecoin-based services such as crypto trading, stablecoin balances, and potentially cross-border payments or savings alternatives. The objective is to leverage Ualá's existing wallet, brokerage, and banking infrastructure to offer a regulated and user-friendly crypto experience while positioning the platform to benefit from increasing adoption of digital assets in the region. Similar to other new initiatives in this plan, 2026 reflects primarily build and integration costs, with the major revenue and user growth impact expected to ramp from 2027 onward as the product suite expands.

New banking business lines

- As part of the 2026 strategy, we will more actively leverage our banking license to generate new revenue streams through capital markets and credit intermediation opportunities (i.e. third party portfolio purchases), including instruments such as marketable promissory notes, deferred payment checks.

10. Potential Upsides

1. Proyecto RAIZ — Pending Accounting Treatment (Alau / Ualá Bank Merger)

- The 2026 budget does not currently reflect the accounting impact of Proyecto RAIZ, the partial merger of Alau into Ualá Bank.
- Under the transaction as currently structured, the merger would transfer Alau's net assets — estimated at ARS 32,578 MM as of December 2025 — into Ualá Bank, with an effective date of January 1, 2026 and subject to shareholder assembly approval expected in April 2026.
- This would represent a material increase to Ualá Bank's book equity and a corresponding improvement in its regulatory capital position, potentially therefore reducing HoldCo capital requirements from the current estimate. The accounting treatment of the merger, including the interaction between the retroactive effective date and the assembly approval date, the BCRA regulatory capital implications, and the correct periodization of P&L items, is currently under review with our auditors and the BCRA. Once we have sufficient clarity, we will update the budget to incorporate the full impact.
- **Should the accounting conclusions require it, we will restate the relevant prior periods accordingly.**

2. NPL Portfolio Monetization via SA Structure

- **Overview**
 - We are in conversations regarding the sale of all or a portion of our non-performing loan portfolio to a Sociedad Anónima (SA) buyer, a transaction structure that has become standard practice among Argentina's top-tier banks and large retailers.
 - The commercial rationale is straightforward: SA buyers with accumulated VAT credit can offset that credit against the portfolio purchase, making them willing to pay materially more than a traditional trust structure — in some cases 2x–5x higher prices. This creates a meaningful opportunity to recover above our current plan assumptions.
- **Current Plan Assumption**
 - Our 2026 budget models an ~8% recovery rate on a gross NPL stock of ~USD 136M (75% provisioned under IFRS, implying a net book value of ~USD 34M), resulting in a base case recovery of USD 10.2M. Since this is below the net book value, the base case implies recognizing an additional loss of ~USD 23.7M on the residual unprovisioned balance.
- **Sensitivity: Recovery Rate vs. Net Income & Capital Impact**
 - The table below shows the incremental impact relative to the base case (8%). The breakeven point — where recoveries fully cover the net book value — is reached at a ~25% recovery rate. Any recovery

above USD 34M would generate a net income gain and corresponding equity uplift.

Recovery Rate Starting April-26	Gross Recovery (USD M)	Residual Loss on Book Value (USD M)	Net P&L Impact vs. Base (USD M)
8%	10.2	(23.7)	-
10%	12.5	(21.4)	2.3
12%	14.8	(19.1)	4.6
14%	17.1	(16.8)	6.9
16%	19.4	(14.5)	9.2
18%	21.7	(12.2)	11.5
20%	24.0	(9.9)	13.8
22%	26.3	(7.6)	16.1
24%	28.6	(5.4)	18.4

- *Note: Net P&L impact vs. base case flows directly to IFRS equity. Full breakeven on book value reached at ~25% recovery rate (~USD 20M). No tax applied.*

- **Why This Is Achievable**

- The SA structure creates a buyer willing to pay a premium due to VAT credit efficiency — not purely based on expected cash flows. Backed by a legal opinion from Marval, O'Farrell & Mairal, the transaction is legally clean and operationally straightforward under current BCRA rules (post-closing notification only, no prior approval required). We view achievement of a 16–20% recovery rate as a realistic upside scenario, representing an incremental USD 6–10M improvement to plan.
